

ROWLAND PREMIX

STONE RESTORATION MORTAR

Use

ROWLAND PREMIX is a Stone Restoration mortar for use in the restoration and conservation of natural stone. When mixed with water it produces an easily worked mortar that forms an effective bond with the original stone to produce a repair that will blend both visually and structurally.

Conservation

This mix is ideally suited to conservation principles where replacement with new stone would be over invasive on the fabric and the aesthetics of the structure.

Matching

Our ability to custom match our restoration mortar to the original stone is essential as two buildings containing the same stone originally can be made slightly different in colour or texture as time, pollutants and the weather have their effect.

Composition

The mortar is supplied as a pre-dried ready mix. There are no artificial resins or polymers, which is seen as an advantage as these can produce a repair that is too hard and too dissimilar to the original stone. A typical mix will include the following:

- Various stone dusts
- Aggregates of different sands
- Cement
- Cement pigmentation

Packaging

Supplied in 10kg or 25kg, 3 ply Kraft paper bags with a polythene inner coating.
